

 **MapQuest** Geocoding

Geocoding is the process of matching addresses with latitude and longitude coordinates. The MapQuest Geocoding API allows easy access to the MapQuest geocoding infrastructure through a simple HTTP request. The Geocoding API supports forward geocoding, reverse geocoding, and batch requests of up to 100 locations through one request.

Features

- Single-line address parsing
- 5-box address input (multiple components)
- Forward geocoding
- Reverse geocoding
- Batch geocoding of up to 100 locations
- Detailed confidence codes to provide granular detail about accuracy of results
- Map thumbnails returned with response

Common Uses

- Online ordering systems
- Address verification
- Retail locators
- Real Estate applications
- Routing applications
- Data visualization applications
