

MapQuest Search

The MapQuest Search API provides a simple interface for performing spatial searches on hosted and remote data. Use the Search API to answer questions such as 'Which coffee shops are within a 5-minute drive from my house?' or 'Which data points fall within a particular ZIP code?' The Search API supports four major search functions: radius, rectangle, polygon, and corridor, and includes the ability to search data hosted by MapQuest (such as the POI data table) as well as remote data that can be passed in to the Search API with the search request.

Features

- Spatial Search Operations
- Radius Search
- Polygon Search
- Corridor Search
- Rectangle Search
- Ability to order results in a number of ways, such as ordered by drive time
- Data search (including POI data set, customer data sets, zip code data, etc...)

Common Uses

- Locator applications
- Geofencing
- Sales territory determination
- Transportation (taxi, uber-type)

Contact Us

The MapQuest + Developer Search API is available in our Geospatial Toolkit. Get started free-- up to 15,000 transactions per month! We'll grow with you and your business. Get your free API key and start developing today!
